Our world today (already old)

Web 2.0 content

- 20h of video content uploaded every minute at YouTube (2009)
- 3,024,780,142 photos in Flickr @ 11:52, 12 Nov 2008
- 2 million geotagged photos uploaded each month (2008)

Facebook:

- More than 250 million active users
- More than 120 million users log on to Facebook at least once each day
- More than 1 billion photos uploaded to the site each month

Winner

By combining information from many photos - tags, it seems that we can

Stable patterns

in tagging systems over time

Stable tagging patterns

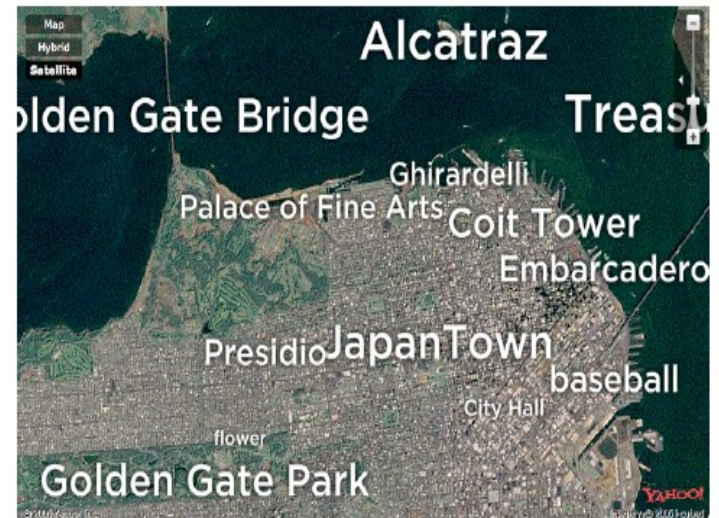

What else we can do?

Tags that are “representative” for a geographical area

- 1. Clustering of photos
 - K-means, based on their location [Kennedy07]
- 2. Rank each cluster’s tags
- 3. Get tags above a certain threshold

Contribute to our understanding of the world

Representative tags for San Francisco [Kennedy07]

Collective Intelligence, PeopleWeb, Croudsourcing, Wisdom of crouds ...

Collective Intelligence is the Intelligence which emerges from the collaboration, competition and coordination among individuals.

...an Intelligence greater than the sum of the individuals' intelligence

CI and Web 2.0?

- Analyze user-generated content, such as tags that are manually assigned to photos, and its relation to context over time, space and social connectivity
- Sources
 - Tags
 - Content
 - Social info
 - Time, Location
 - Other sources (e.g. Wikipedia)

Why today?

A “simple” example

Uses the GPS in cellular phones to gather traffic information, process it, and distribute it back to the phones in real time

- online, real-time data processing
- privacy-preservation
- data efficiency, i.e. not requiring excessive cellular network

Mobile Century Project:

Generating photo summaries

- **Problem formulation:** Having identified a tag x as representative of a cluster, compute a set of photos that are representative for that tag

Generating photo summaries for geographic objects in [Kennedy07]

Sample photo summaries of events [Quacko8]

DATASET: Divide the earth's surface into square tiles of 200m²
70000 geographic tiles
220000 geotagged photos from Flickr
After preprocessing, 73000 photos were assigned to clusters
Manually labeling of 700 clusters

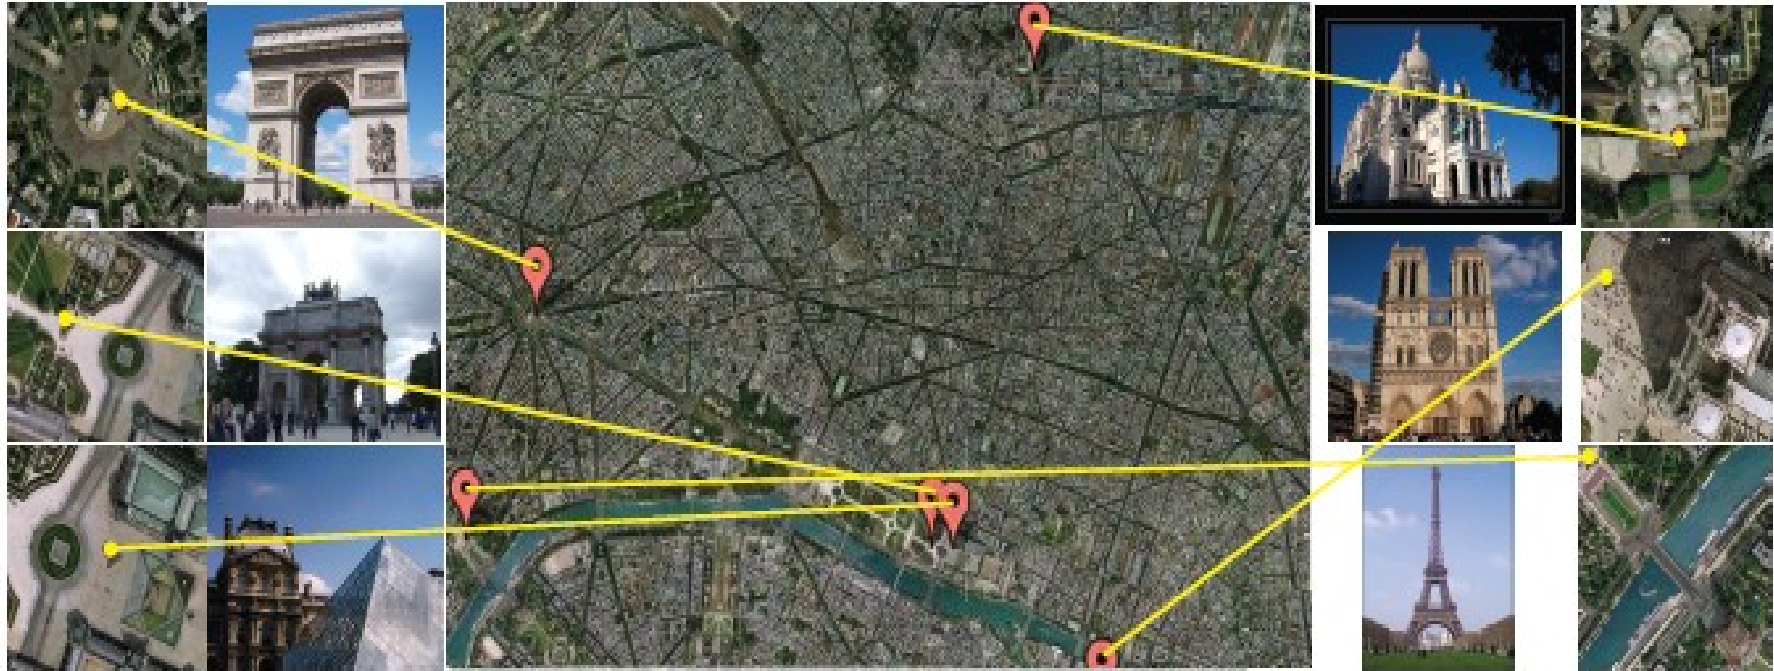

The most commonly identified event (single day covered by a single photographer)

“Oxford Geek nights”

“Movie premiere Italy”

“Exhibition gallery paris”

Auto annotation & geo-location

# Images	222'757
Size Metadata	1.1 GB
Size Features	111 GB
# Images assigned to clusters	73'236
# Similarities computed	217'330'144
# Similarities > 0	751'457

[Quack08]

EpiCollect: Science - epidemiology example

A scientist or member of the public collects and records data, photos and videos then sends this information to a central web-based database

- e.g. to document the presence of an animal or plant species that are “representative” for a geographical area
- Location information – maps
- Citizen scientists

EpiCollect: Linking Smartphones to Web Applications for Epidemiology, Ecology and Community Data Collection, David M. Aanensen, Derek M. Huntley, Edward J. Feil, Fada'a al-Own, Brian G. Spratt

Research Fields and Issues

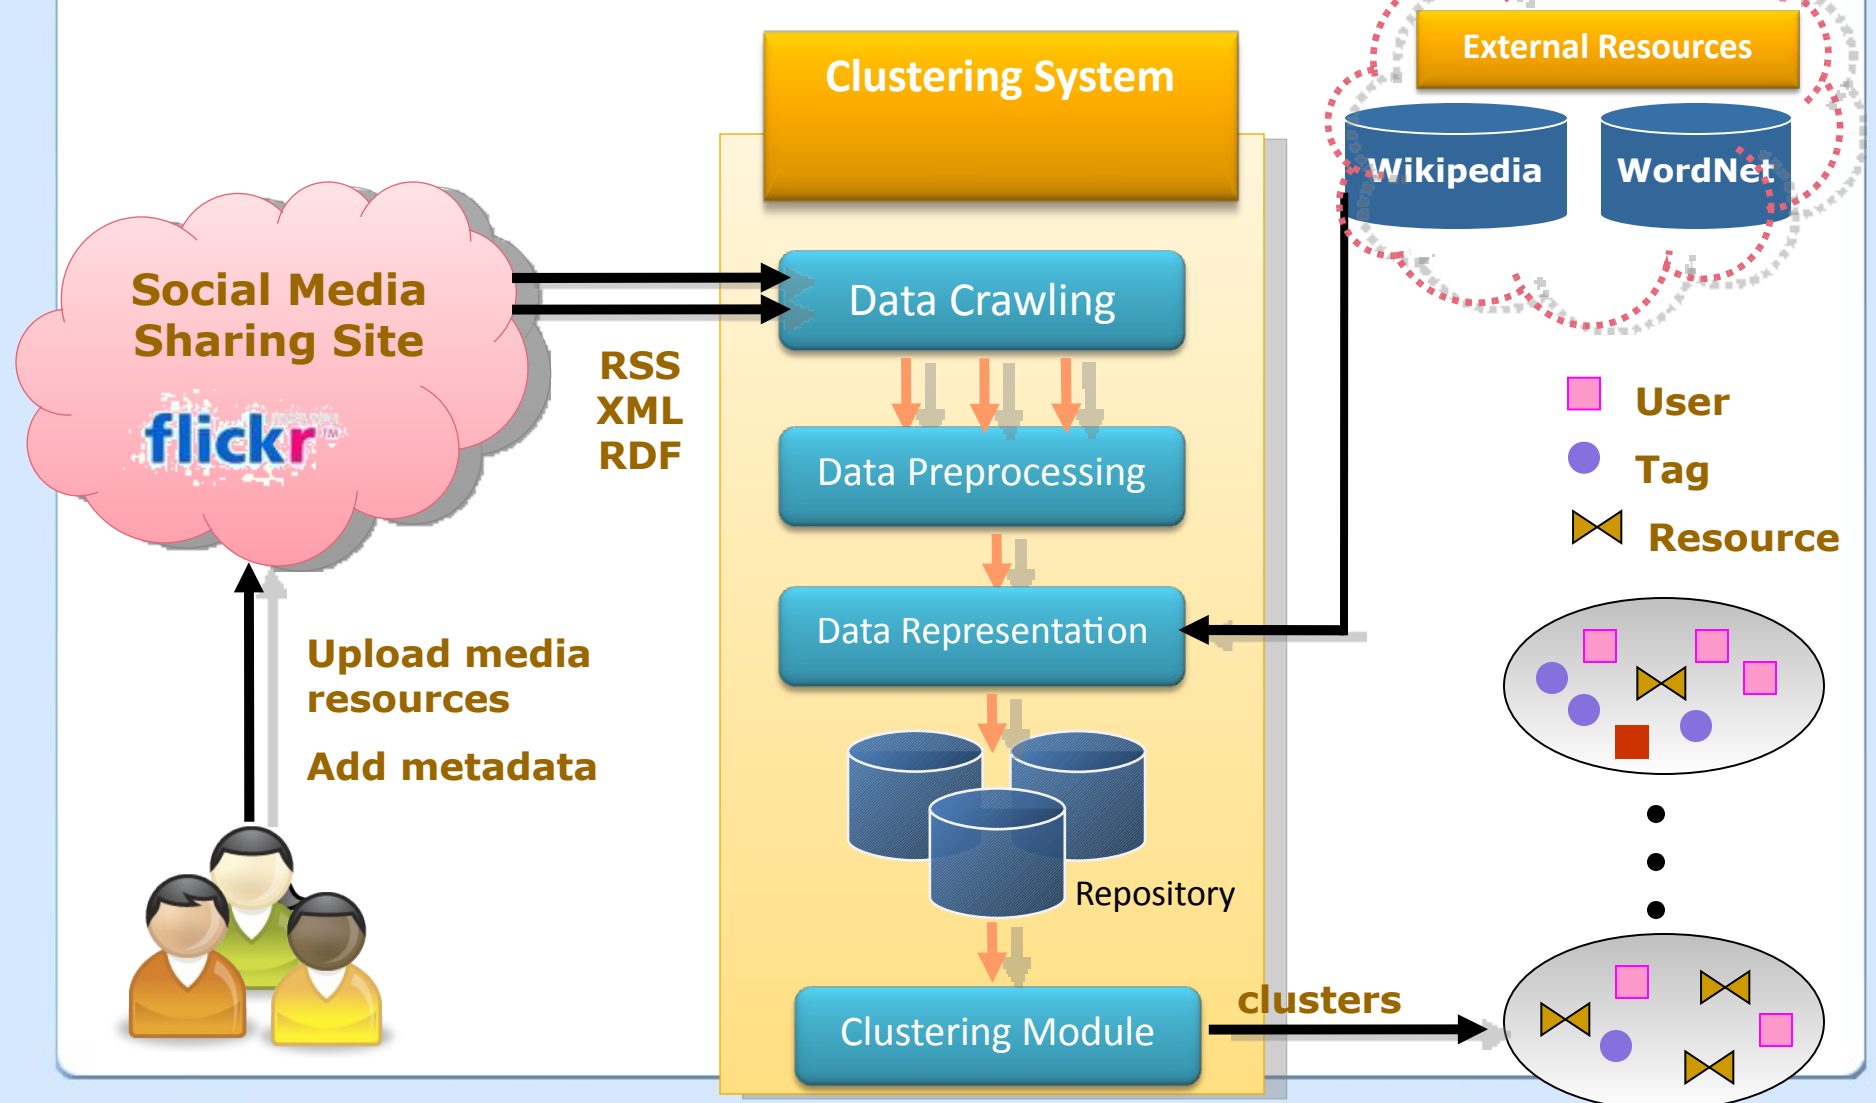

- Statistical analysis, machine learning, data mining, pattern recognition, social network analysis
- Clustering
- Graph theory
- Image, text, video analysis
- Information extraction
- Fusion techniques
- Trust, security, privacy
- Performance, scalability
 - speed, storage, power, grids, clouds

Clustering for Social Media

Clustering Approaches

- Tag-Based
- Content-Based
- Time-based

Proposed system

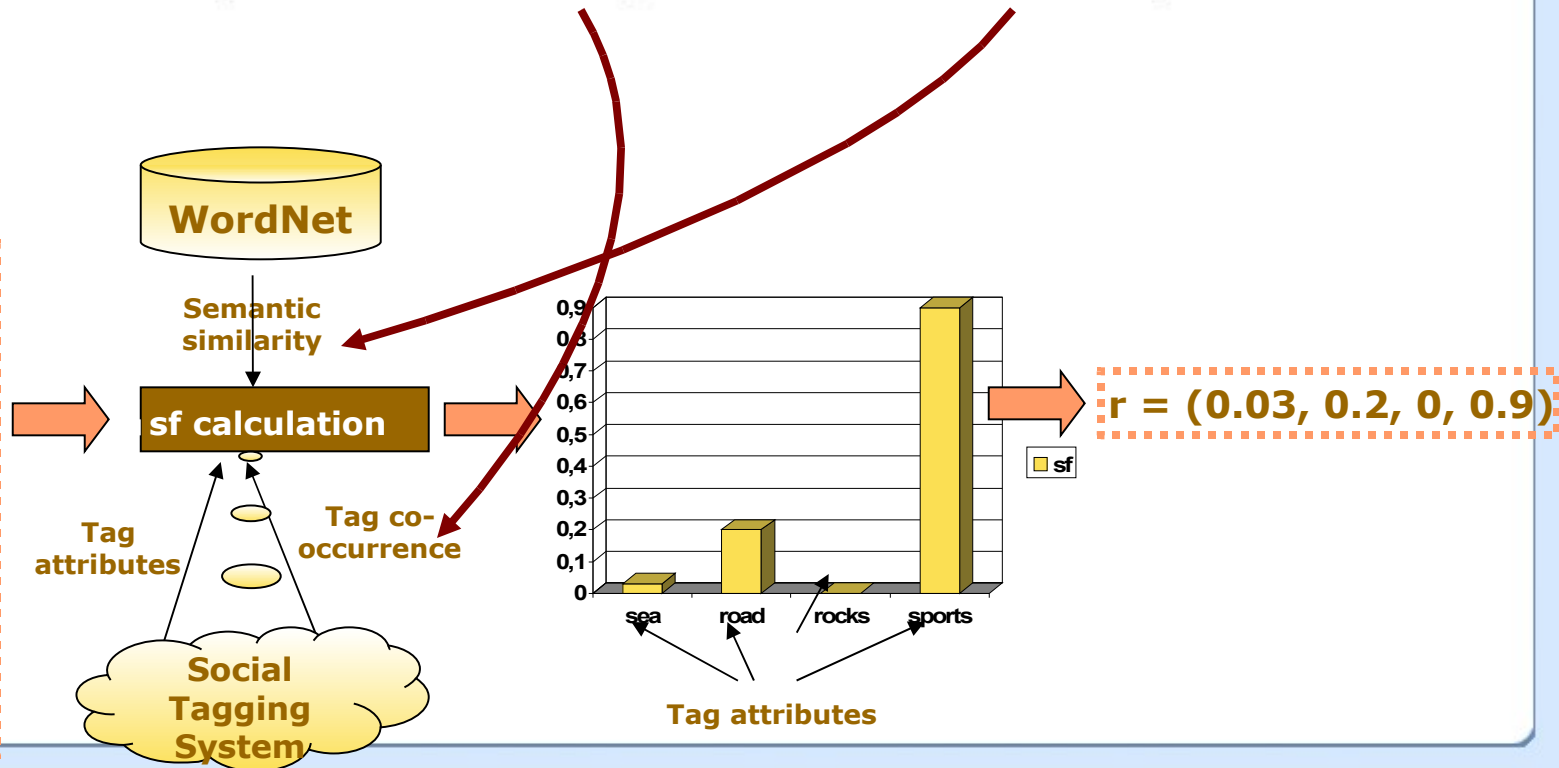

Tag-based Clustering (I)

- **1. Vector data model**
- Assume **n** resources and **d** attribute-tags
 - **d**: a representative set of tags
- A resource representation in vector space (**sf**) is based on **semantic similarity** and **tag co-occurrence** between the resource's tags and the attribute-tags
- A resource r_i is represented by a **d**-dimensional vector $r_i = (\mathbf{sf}_1, \mathbf{sf}_2, \dots, \mathbf{sf}_d)$
- All resources can be represented by an **n** x **d** matrix

Tag-based Clustering (II)

- 2. Clustering on n (resources, r) \times d (attributes) matrix (K-means, Hierarchical, COBWEB)

$$SS(t_x, t_y) = w * SoS(t_x, t_y) + (1 - w) * SeS(t_x, t_y)$$

Tag-based Clustering - Experimental Results

- **Dataset:** 3000 images downloaded from Flickr
- Meaningful subdomains of **roadside:**
buildings, roof, street, road

(a)

cars, vehicles, race

(b)

people, street, festival

(c)

- Different clusters for the **ambiguous tag** *wave, rock*:

wave, sea, ocean

(a)

wave, person, hand

(b)

rocks, stone, rockside

rock, music, band

Tag & Content-based Clustering

- After performing tag-based clustering, low-level features of resources are used for cluster refinement
- Outlier Detection (mahalanobis distance)
- For each resource the following visual descriptors are extracted:
 - Scalable Color, SC
 - Color Structure, CS
 - Color Layout, CL
 - Edge Histogram, EH
 - Homogenous Texture, HT
- A single image feature vector per each resource is produced, encompassing all descriptors normalized in $[0,1]$
- Feature extraction and distances between image feature vectors are according to MPEG-7 XM.

Evaluation Method

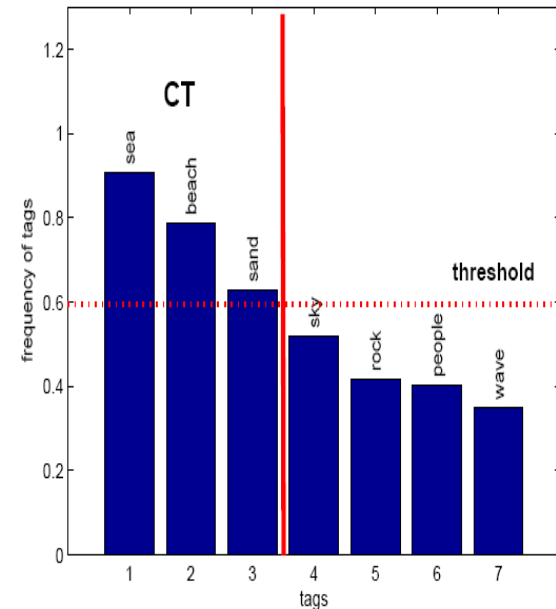

- **Definition:** Cluster Topic, CT, are the tags that have frequency in cluster's resources annotation over a threshold τ .

- **Evaluation Metrics**

- Precision $Pr(C_j) = \frac{|C_j \cap RR(C_j)|}{|C_j|}$

- Recall $R(C_j) = \frac{|RR(C_j) \cap C_j|}{|RR(C_j)|}$

- F-Measure $F(C_j) = \frac{2 * Pr(C_j) * R(C_j)}{Pr(C_j) + R(C_j)}$

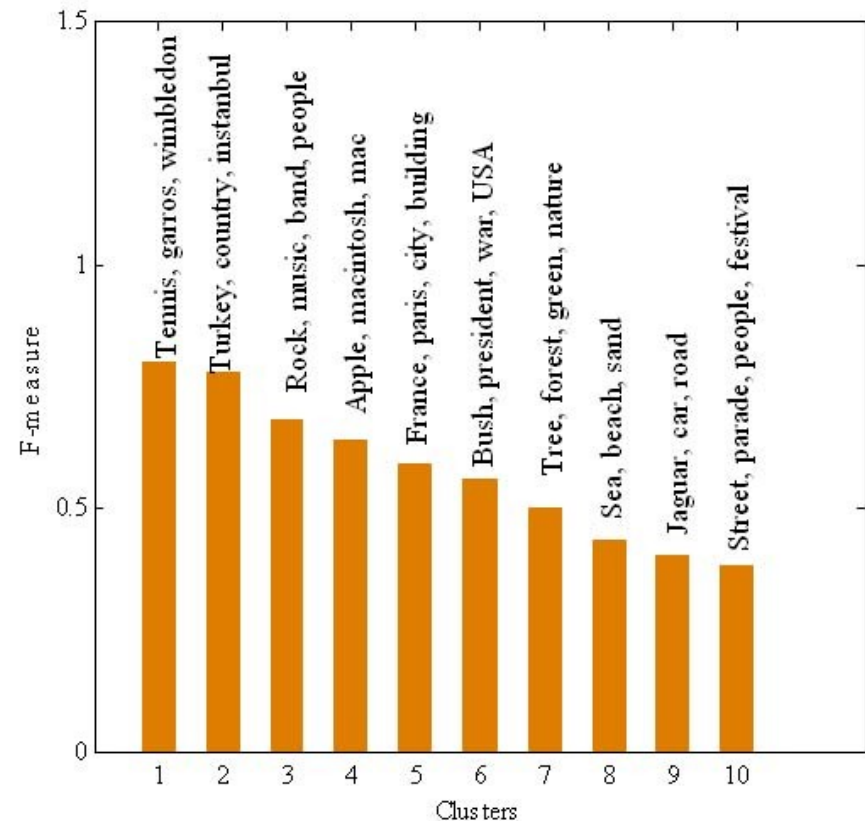

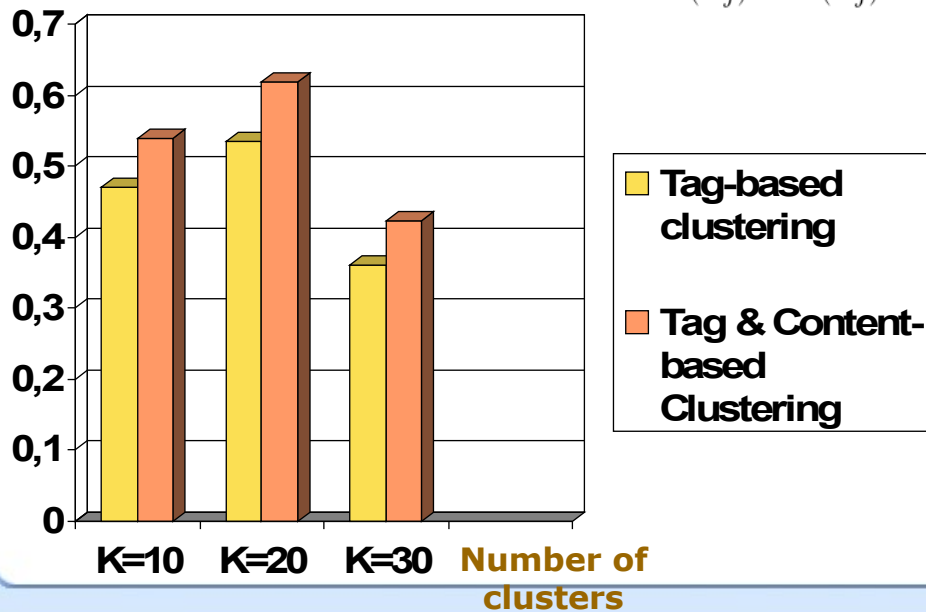

Tag & Content-based Clustering – Experimental Results

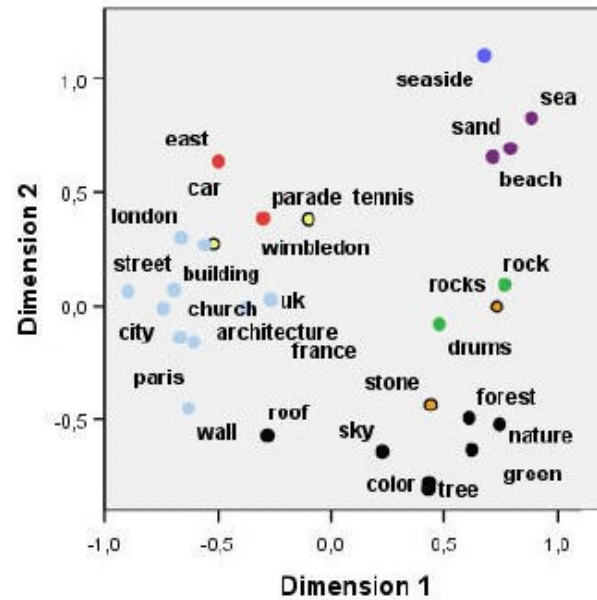

Dataset: 10000 images (with their tags) downloaded from Flickr

Evaluation: Manual annotation and use of F-Measure.

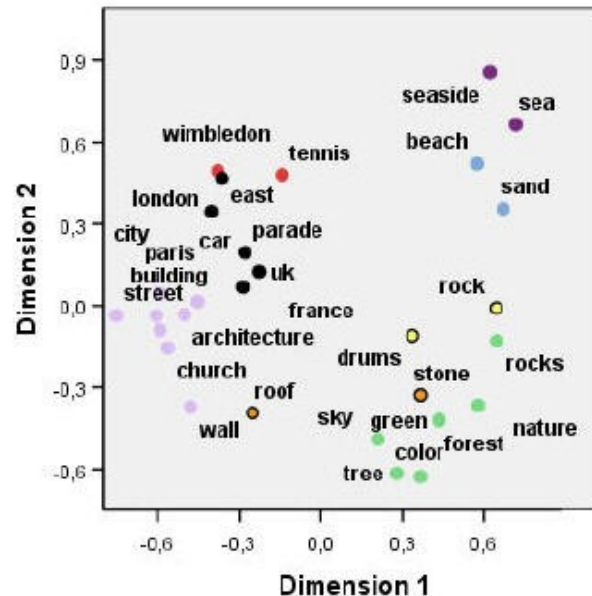

$$F(C_j) = \frac{2 * Pr(C_j) * R(C_j)}{Pr(C_j) + R(C_j)}$$

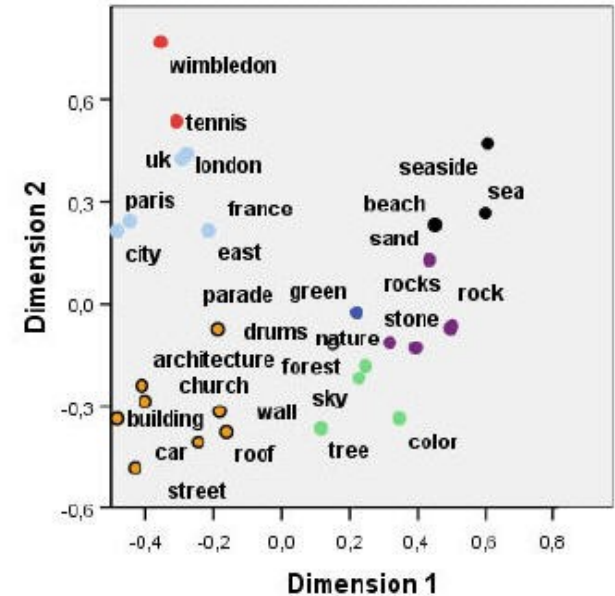

Experimental Results (II)

(a) $w = 0.2$

(b) $w = 0.5$

(c) $w = 0.8$

Attributes Assignment to $k=8$ clusters,

w : weighting factor of semantic similarity against similarity derived from tag co-occurrence

Why consider time?

- Motivation

Events, Trends, Changing of user interests

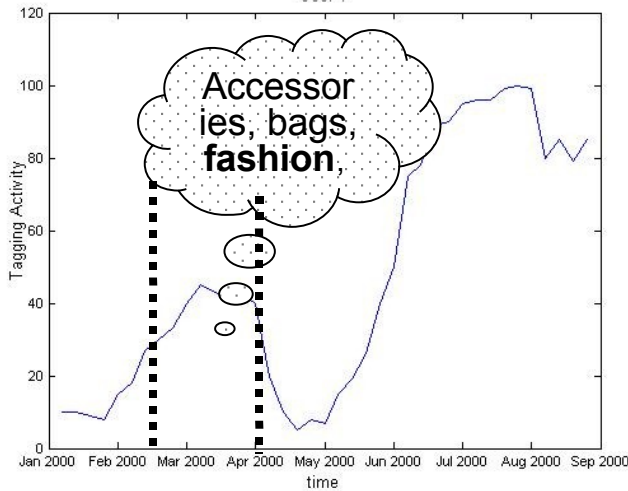

Users Tagging Behavior changes over time

Time is a fundamental dimension in analysis of users and tags in a social tagging system

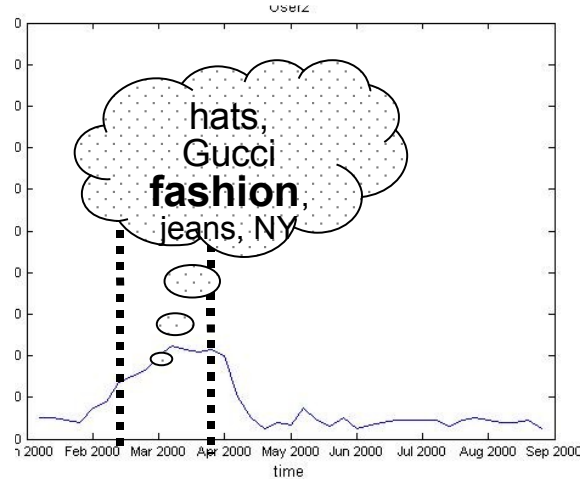

Many times, a user's targeted interest is hidden in the general tagging activity....

User 1

Cars, football, holidays, horses, sea, turkey, fashion

User 2

New York, hat, trousers, fashion, Gucci

User 3

animals, elephants, nature sea, turkey, bags

The basic idea

$$UTF = \begin{matrix} & i_1 & i_2 & \dots & i_D \\ u_1 & \begin{bmatrix} ut_{11} & ut_{12} & \dots & ut_{1D} \end{bmatrix} \\ u_2 & \begin{bmatrix} ut_{21} & ut_{22} & \dots & ut_{2D} \end{bmatrix} \\ \vdots & \begin{bmatrix} \vdots & \vdots & \ddots & \vdots \end{bmatrix} \\ u_N & \begin{bmatrix} ut_{N1} & ut_{N2} & \dots & ut_{ND} \end{bmatrix} \end{matrix},$$

$$TTF = \begin{matrix} & i_1 & i_2 & \dots & i_D \\ t_1 & \begin{bmatrix} tt_{11} & tt_{12} & \dots & tt_{1D} \end{bmatrix} \\ t_2 & \begin{bmatrix} tt_{21} & tt_{22} & \dots & tt_{2D} \end{bmatrix} \\ \vdots & \begin{bmatrix} \vdots & \vdots & \ddots & \vdots \end{bmatrix} \\ t_S & \begin{bmatrix} tt_{S1} & tt_{S2} & \dots & tt_{SD} \end{bmatrix} \end{matrix},$$

Step 1: Representation

Step 3: Focus on time locality

$$\langle u_j, t_k \rangle = \frac{u_j * t_k}{\sqrt{\sum_{j=1}^N u_i^2 * \sum_{k=1}^S t_k^2}}$$

Step 4: Combination of semantic and time information

$$(u_p, t_j) = SemSim(u_p, t_j) * InnerProduct(u_p, t_j)$$

WordNet

Step 2: Focus on contents (tags semantics)

$$\begin{matrix} & t_1 & t_2 & \dots & t_D \\ u_1 & \begin{bmatrix} w_{11} & w_{12} & \dots & w_{1D} \end{bmatrix} \\ u_2 & \begin{bmatrix} w_{21} & w_{22} & \dots & w_{2D} \end{bmatrix} \\ \vdots & \begin{bmatrix} \vdots & \vdots & \ddots & \vdots \end{bmatrix} \\ u_S & \begin{bmatrix} w_{S1} & w_{S2} & \dots & w_{SD} \end{bmatrix} \end{matrix}$$

An example

$$(u_i, t_j) = \text{SemSim}(u_i, t_j) * \text{InnerProduct}(u_i, t_j)$$

Social Media “teacher” of the machine

Exploiting clustering for machine learning

Objective: Develop a framework able to create strongly annotated training samples from weakly annotated images

Tagged images

sand, wave, rock, sky

sea, sand

sand, sky

person, sand, wave, sea

Social information +

Image analysis

Solutions:

- ❖ Exploit user tagged images from social sites like flickr
- ❖ Combine techniques operating on tag and visual information space

Problems:

- ❖ Object detection schemes require region-detail annotations
- ❖ Manual annotation is laborious and time consuming

Region-detail annotated

[Chatzilari09]

Machine Learning

Step 1: Process image tag information in order to acquire image groups each one emphasizing on a particular object

Step 2: Pick an image group so as its most frequent tag to conceptually relate with the object of interest.

sand, wave, rock, sky

sea, sand

sand, sky

person, sand, wave, sea

Step 3: Segment all images in the selected image group into regions.

Step 4: Extract the visual features of these regions.

Step 5: Perform feature-based clustering so as to create groups of similar regions

Step 6: Use the visual features extracted from the regions belonging to the most populated cluster, to train a machine learning-based object detector.

Tag-based processing

[Giannakidou08]

SEMSOC, vector space model where each image is projected onto a space defined by the most prominent tags

SEMSOC output example

Distribution of objects based on their frequency rank

Absolute difference between 1st and 2nd most highly ranked objects increases as n increases

Segmentation & Visual Descriptors

- Segmentation

- K-means with connectivity constraint (KMCC)

[Mezaris et al., 2004]

- Visual Descriptors

- MPEG-7 standard

- *Dominant Color , Color Layout, Color Structure, Scalable Color, Edge Histogram, Homogeneous Texture, Region Shape.*

[Bober et al., 2001], [Manjunath et al., 2001].

Region-based Clustering & Cluster Selection

Region clustering

- ❖ Perform segmentation and visual feature extraction from all images in an image group (Identified by SEMSOC)

- ❖ Perform clustering based on visual features to gather together regions depicting the same object

- ❖ Pick the most populated cluster as the one representing the most frequently appearing tag of the group

Experimental Results – Cluster Selection

Setting:

- Visualise the way regions are distributed among clusters
- Use shape-code (squares) to indicate the regions of interest and color-code to indicate a cluster's rank (largest cluster: red)
- Ideally all squares should be painted red and all dots should be painted differently

Goal:

- Validate our theoretical claim that the most populated cluster contains the majority of regions depicting the object of interest

Conclusions:

- Our claim is valid in 5 (i.e., sky, sea, person, vegetation, rock) and not valid in 2 (i.e., boat, sand) cases

Vegetation in magnification

Experimental Results - Man. vs Autom. trained object detectors

Observations:

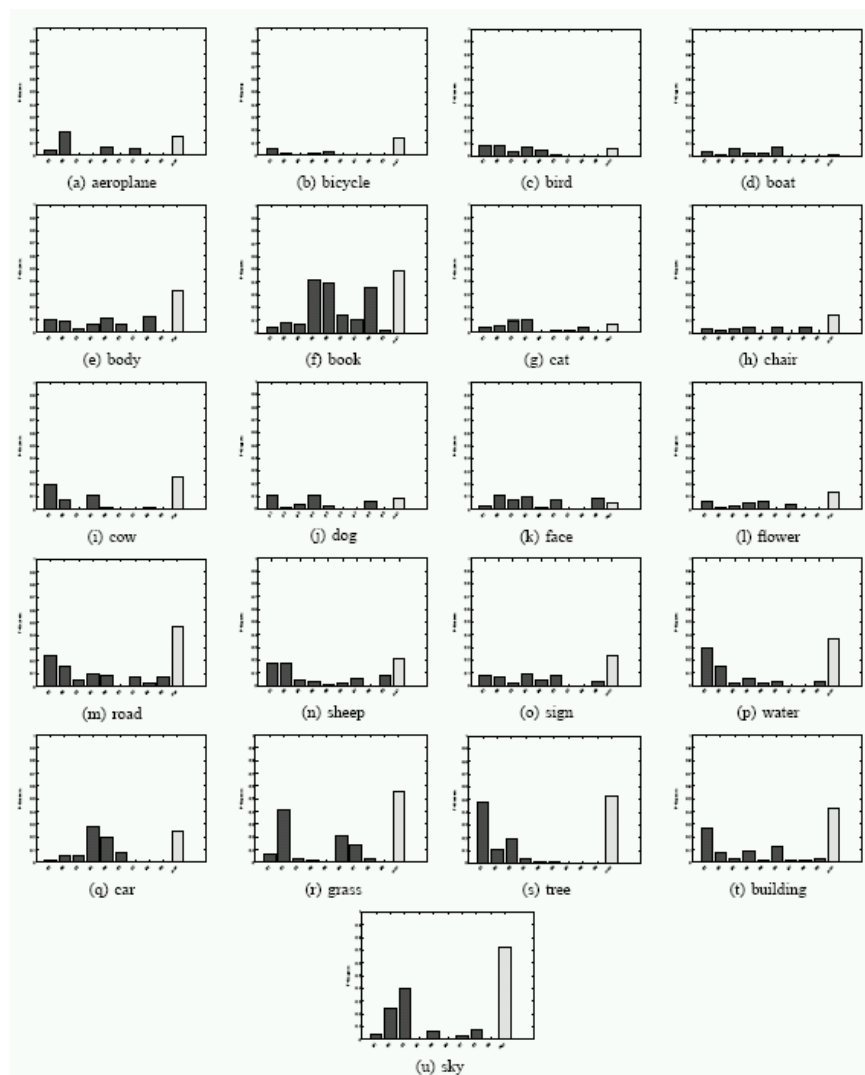

- Performance lower than manually trained detectors
- Consistent performance improvement as the dataset size increases

Experimental Results – MSRC Dataset (21 objects)

Observations:

- In 5 cases the objects were too diversiform to be described by the employed feature space (not even the manual annotations performed well)
- In 5 cases the annotation we got from Flickr groups were not appropriate
- In 6 cases, our method has failed to select the appropriate cluster
- In 5 cases our method worked well

Experimental Results - MSRC vs Flickr groups

Target object: Tree

Tree object

Good example: Semantic objects are correctly assigned to clusters and the most-populated cluster corresponds to the target object)

Experimental Results - MSRC vs Flickr groups

Target Object: Sky

Sky object

Bad example: Sky regions are split in many clusters and the most populated cluster contains noise regions

#1 Cluster - architecture (statues, buildings)

#2 Cluster - sky (but a bit noisy)

#3 Cluster - sky (best performing model)

#5 Cluster - noise

#6 Cluster - sky (mostly dark)

#7 Cluster - sky (mostly light)

Community Detection

Community Detection in Complex Networks

- Community Detection: The Problem
- Global vs. Local Community Detection
- Bridge Bounding
- Conclusions - Future Work

communities context ...

- typically ... communities are defined with reference to some graph (network) which represents a set of entities / objects (nodes) and their relations (edges).
- ... even when there is no explicit graph, one can infer it, e.g.:
- feature vectors → distances → threshold
application → graph
- Given a graph, a community is loosely defined as a set of nodes that are more densely connected to each other than to the rest of the graph vertices.

a simple example ...

- extremely profound community structure.
- key-concepts : within-community nodes, intra-community edges, inter-community edges.
- rarely appearing in real systems.

Definition of communities is heavily dependent on graph properties and subgraphs discovery

Global vs. Local

- **Global:** Process the whole graph to derive a partition into communities
 - + Abundant research
 - + Good results (community quality, algorithm efficiency)
 - Not practical for huge graphs or for real-time applications
- **Local:** Incremental process of the graph and output communities (streaming)
 - Relatively little research
 - Great potential for demanding applications

Bridge Bounding

Algorithm

- Start a community with a seed node
- Add neighbouring nodes as long as they are connected by edges that are not inter-community (“bridges”).
- Stop when it is not possible to add any more nodes.

Basic success factor:

Edge Bridge-ness: The property of an edge to lie between two communities.

Algorithm 1 LocalCommunityDetection

Require: Seed node $s \in G = (V, E)$

Require: Community mapping $g_C : V \rightarrow \mathbf{P}$

Require: Bridge function $b : E \rightarrow [0.0, 1.0]$

```
1:  $C_s = \emptyset$ 
2: Frontier set  $F = \{s\}$ 
3: while  $|F| > 0$  do  $\{F$  is non-empty $\}$ 
4:    $c \leftarrow F.\text{pop}()$ 
5:    $C_s \leftarrow C_s \cup \{c\}$ 
6:    $C_U \leftarrow C_U \setminus \{c\}$ 
7:   for all  $n \in N(c)$  such that  $e_{cn} = (c, n) \in E$  do
8:     if  $g_C(n) = C_U$  and  $b(e_{cn}) \leq B_L$  then
9:        $F.\text{push}(n)$ 
10:    end if
11:  end for
12: end while
13:  $\mathbf{P} \leftarrow \mathbf{P} \cup C_s$ 
```

Bridge Bounding – Toy Example

Local bridging of an edge

$$b_l(e_{st}) = 1 - C_{st}^{(3)} = 1 - \frac{|N(s) \cap N(t)|}{\min[(d(s) - 1), (d(t) - 1)]}$$

s, t : endpoints of edge

$N(s), N(t)$: neighbourhoods of s, t

$d(s), d(t)$: degrees of s, t

Bridge Bounding - Problems

- Local bridging not suitable for scale-free networks
- Solution (partial) 2nd order local bridging.

$$b'_L(e_{st}) = \alpha \cdot b_L(e_{st}) + (1 - \alpha) \frac{1}{|N(e_{st})|} \sum_{e \in N(e_{st})} b_L(e)$$

$B_L = 0.17$ leaves just 1% of edges as non-bridges.

B_L as low as 0.05 leaves 8% of edges as non-bridges.

(a) b_L distribution

(b) b'_L distribution, $\alpha = 0.7$

Experiments on Synthetic Community Networks

- Synthetic networks according to method of Newman and Girvan.

$$S_{PAR} = \{N, K, z_{tot}, p_{out}, s_{var}\}$$

(a) $p_{out} = 0.01$

(b) $p_{out} = 0.08$

Change complexity of underlying communities.

p_{out}	F_C			NMI

LYCOS iQ Tag Network

(a) Music

(b) Science

(c) Film

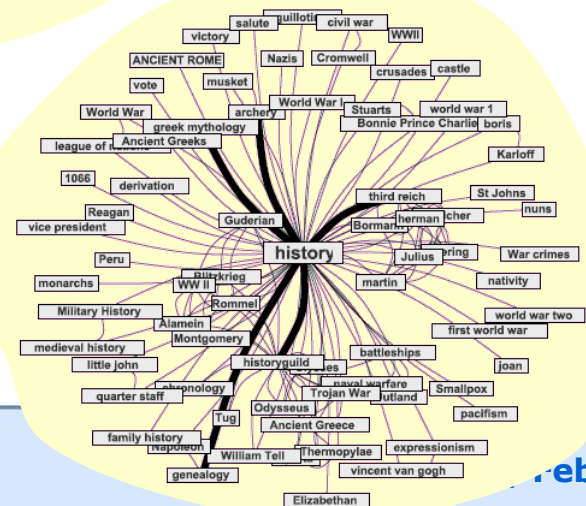

(d) Animals

Computers:
A densely interconnected community

History:
A star-shaped community

Future Work for Community Detection

- Investigate label propagation techniques.
 - Application on external memory graphs.
- Possibilities for incremental community detection.
 - Application on large dynamic networks (e.g. Social Tagging Systems)
- Applications on different domains:
 - Hybrid image clustering (use of both visual and tag features)
 - Domain-specific clustering, e.g. Points-Of-Interest in travel applications.

WeKnowIt and CI

on

Further Issues

- Not all data always available (e.g. User queries, fb)
- Long tail is forgotten (e.g. flu trends in 3rd world countries)
- “More data, less analysis”,.....
- Applications and commercialization
- Efficiency of semantics and analysis
- Real integration
 - not just sum of different analysis
 - formal framework and approach
 - representation
- User interaction – Interfaces

Thank you!
